

Metal Oxide Varistors

Varistor>34S201~162K Series

Applications

- Transistor, diode, IC, thyristor or triac semiconductor protection.
- Surge protection in consumer electronics.
- Surge protection in industrial electronics.
- Surge protection in electronic home appliances, gas and petroleum appliances.
- Relay and electromagnetic valve surge absorption.

Features

- Wide operating voltage (V1mA) range from 8V to 1800V.
- Fast responding to transient over-voltage.
- Large absorbing transient energy capability.
- Low clamping ratio and no following-on current.

General Information

The MOV-34SxxxK Series of 34 mm radial leaded varistor devices protects against overvoltage transients such as lightning, power contact and power induction. The metal oxide varistors offer a choice of varistor voltages from 200 V to 1600 V and Vrms voltages from 130 V to 1000 V.

The devices have a high current handling, high energy absorption capability and fast response times to protect against transient faults up to rated limits.

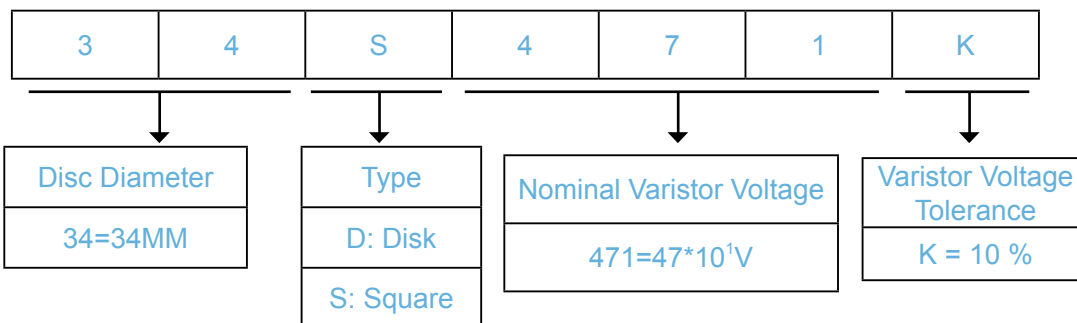

General Characteristics

No Radioactive Material
 Storage Temperature: -55°C to +125°C
 Operating Temperature: -55°C to +85°C
 Body: Nickel Plated
 Leads: Surface-mount, Axial Devices: Tin Plated
 Devices with No Leads: Nickel Plated

Packaging Information

Current Energy and Power Dissipation Ratings

Should transients occur in rapid succession, the average power dissipation is the energy (watt-seconds) per pulse times the number of pulses per second. The power so developed must be within the specifications shown on the Device Ratings and Specifications Table for the specific

device. The operating values of a MOV need to be derated at high temperatures as shown above. Because varistors only dissipate a relatively small amount of average power they are not suitable for repetitive applications that involve substantial amounts of average power dissipation.

Figure 1A - Power Derating for Epoxy Coated

Figure 1B - Power Derating for Pholenic Coated

Peak Pulse Current Test Waveform

Figure 2

- O_1 = Virtual Origin of Wave
- T = Time from 10% to 90% of Peak
- T_1 = Rise Time = $1.25 \times T$
- T_2 = Decay Time

Example - For an 8/20 μ s Current Waveform:

- $8\mu\text{s} = T_1 = \text{Rise Time}$
- $20\mu\text{s} = T_2 = \text{Decay Time}$
